

Awareness Simulation Project

Climate change is not just an environmental issue but also a crisis that deeply affects the social structure.

This project aims to raise awareness of how climate change exacerbates gender inequality through a simulation experience.

Objective: To understand how existing gender inequalities intensify due to the effects of the climate crisis.

Climate Change and Its Impact on Society

Objective and Scope of the Simulation

Gender Inequality and Climate Change

Simulation Scenario Solutions and Raising Awareness

Climate Change's Impact on Society

Climate change disproportionately affects vulnerable communities, especially the poor.

It exacerbates social issues such as migration, unemployment, and food and water security.

Existing social inequalities, such as income disparity and access to education and healthcare, are further magnified by climate impacts.

Climate Change and Gender Inequality

Women and girls are disproportionately affected by the impacts of climate change.

As resources become scarce, women are burdened with more responsibilities such as water and fuel collection, limiting their access to education and participation in the workforce.

In agriculture-dependent communities, women face increased workloads and economic strain.

Objective and Scope of the Simulation

Simulation Scope:

• Different scenarios: Natural disasters, water scarcity, migration crises.

Unequal distribution of labor and responsibilities between genders.

• The impact of these inequalities on women's quality of life.

Conclusion and Future Steps

To take steps toward a more just and gender-equal approach in the fight against climate change.
